\(^1\)The source of these figures is unimpeachable: they represent my own impressions over the course of many years of reading.

\(^2\)In the interest of full disclosure, I stopped reading when I hit 4,000 words.

\(^3\)The one instance in which I heard a word uttered by a mathematician occurred when a non-English-speaking visitor remarked in some surprise: “It goes without saying goodbye.” His “it” was referring to a person (a male in this instance), and the use of the word “goes” was incorrect. What the speaker had been trying to say was, “He left without saying goodbye.” I feel that I must include this, although it still doesn’t affect the average rounded to two decimal places.
